

# OSX Yosemite

## Installation du système :

4 Go de mémoire centrale  
Maximum de mémoire vidée  
40 Go de disque  
1024x768

disable EFI  
Bridge Adaptor réseau

[https://www.youtube.com/watch?v=2\\_QF69g5iAY](https://www.youtube.com/watch?v=2_QF69g5iAY)

L'installation s'arrête à 2 minutes avant la fin. Fermer la VM.

## Pour les deux minutes restantes :

<http://www.cloudnetwork.in/2015/03/solution-for-2-minutes-left-problem-on-mac-os-x-yosemite.html>

1. Close the VMachine when stuck on 2 minutes left (Power off)
2. Start it again, select newly created

hd(0,2) <yourpartitionname>

and type options on boot line :

Step1 :- -s -v -x

3. You will get to bash, run two given commands to mount root device. or just see above 4 lines you will find two category ...

Step2 :- /sbin/fsck -fy

and when it finishes:

Step3 :- /sbin/mount -uw /

4. Now move to the directory:

Step4 :- cd /.OSInstallSandboxPath/Scripts/

and show its files:

Step5 :- ls

5. In the result you need to find the .xxxxxx from Hackintosh.Zone.Post-Script.xxxxxx line (it's different for everybody, for example xSDnsS for me) and then move to that directory:

Step6 :- cd Hackintosh.Zone.Post-Script.xSDnsS ( <- this must be changed for your .xxxxxx )

and execute:

Step7 :- ./postinstall

6. When it finishes just type:

exit

and in a minute you should see the login screen of your newly booted OS X Yosemite VM :)

NOTE :- For Any Clarification Please Below
